

To enable and use plugins like Code Interpreter, RAG, and Artifacts, follow these steps:

1. Navigate to settings by clicking the user icon in the top right corner, and selecting "Settings"

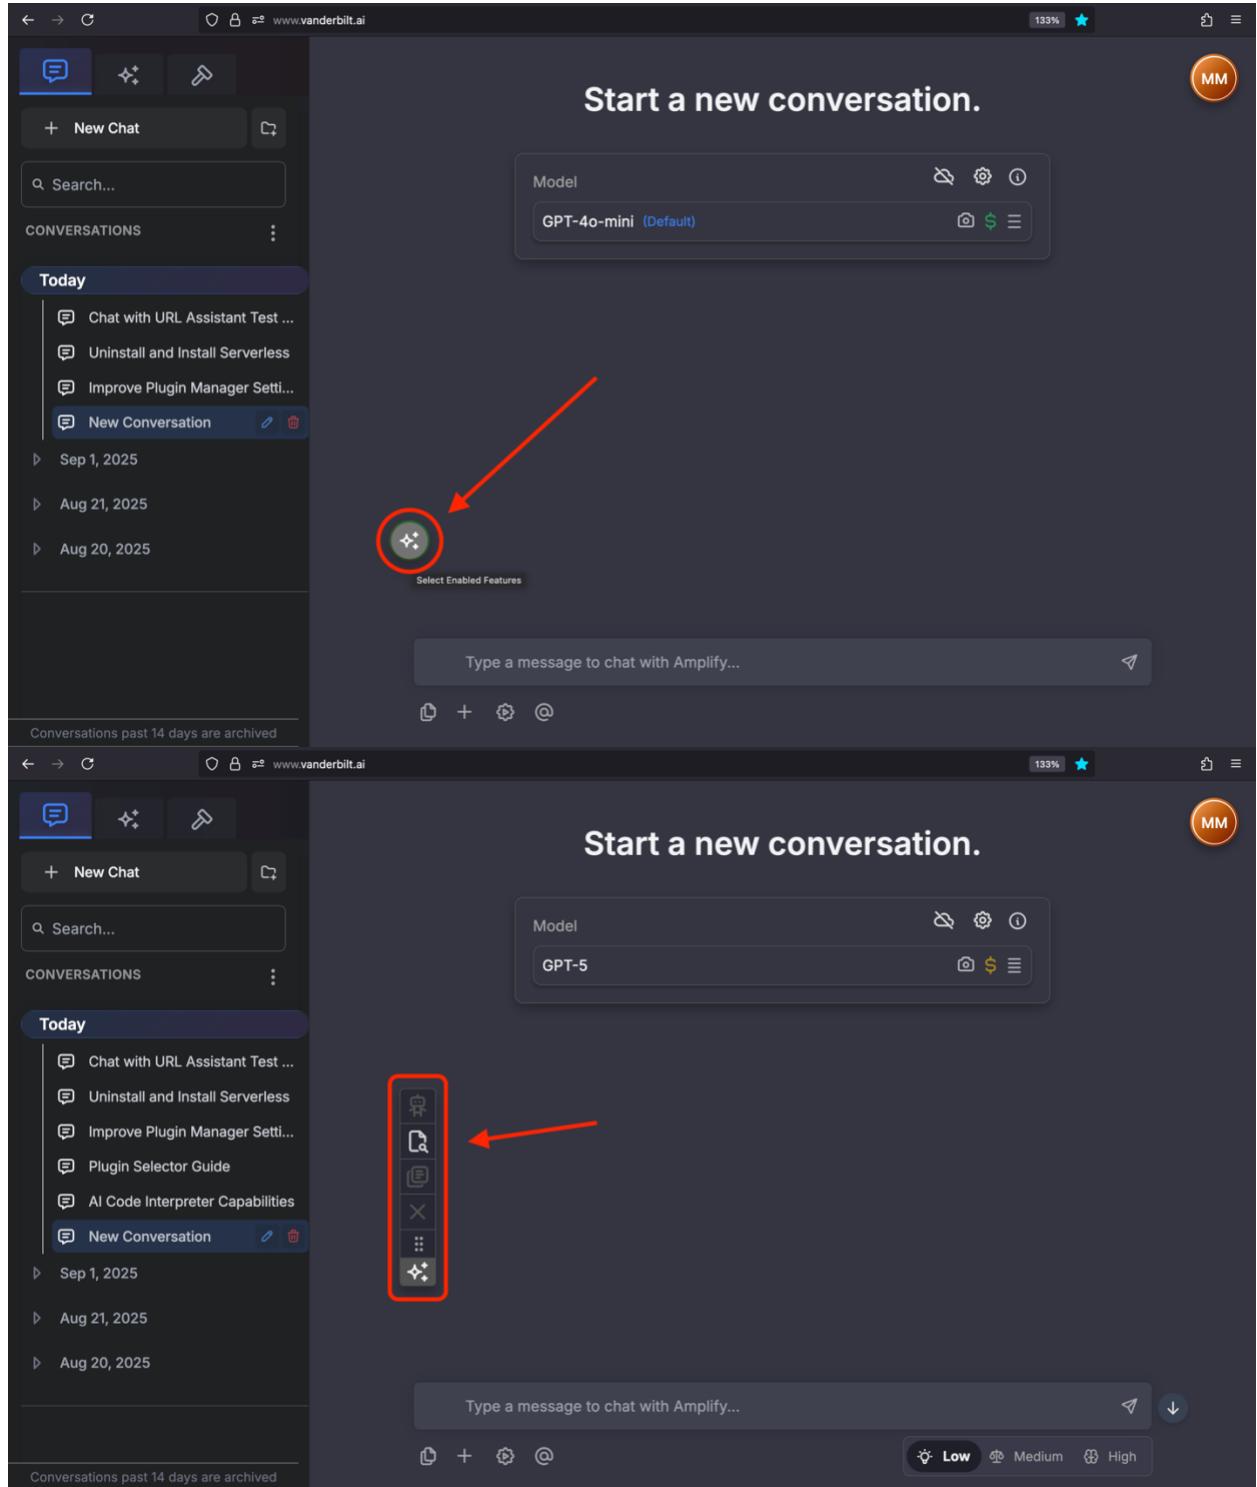

2. Scroll down to the "Features" section of the Configurations tab, select "Plugin Selector," and click both "Plugin Selector" and "Save" if it isn't already selected.

A screenshot of the 'Settings' page in the Amplify AI interface. The 'Configurations' tab is selected. In the 'Features' section, there is a list of checkboxes:

- Artifacts
- Smart Focused Messages
- Plugin Selector
- Prompt Highlighter
- Memory

The 'Plugin Selector' checkbox and its associated description are highlighted with a red rectangle. At the bottom right of the page, there are 'Cancel' and 'Save' buttons.

3. The Plugin Selector now appears in your conversation. Click it to view the options. A highlighted (glowing) button means the feature is enabled; a dimmed button means it's disabled. Options are listed from top to bottom:

- Robot icon — Code Interpreter: lets the model write and run Python code; ideal for data analysis, math and simulations, data cleaning/transformation, generating charts, parsing files, and validating results with executable code.

- b. Document with magnifying glass — RAG: includes only relevant sections of uploaded documents in the conversation. Turn this off to include entire documents.
- c. Stacked papers icon — Artifacts: enables artifact creation; ideal for producing persistent outputs like reports, code files, notebooks, design docs, dashboards, or multi-step deliverables you can open, edit, and share.
